

ABSTRACT OF THE DISCLOSURE

The present invention provides a file transfer system in which the image data photographed at a destination place by the user is easily transferred to a specific file server. Specifically, a memory card reader (reading means) 1 is controlled by a system controller 2. A memory card 6 is a recording medium for saving an image data file. A modem 7 has a function of implementing the external communications with the memory card reader 1 employing a telephone line. In a specific recording area of the recording medium, the positional information indicating the position of any specific region on the file servers 16, 17, 18 is recorded, and when the recording medium is mounted on the reading means 1, the reading means 1 reads the positional information and the file, and the file transfer means transfers the file read in the specific region on the file servers indicated by the positional information read by the reading means 1.
